

LEARA

Commerce, connected.

One system around the systems you already use.

LEARA.SE

Commerce runs across more systems than ever.

Stores, e-commerce, warehouses, marketplaces, ERP, POS, payments, logistics — each part can work well on its own. Together, the whole often becomes fragmented. Information sits in silos. Operations lose context.

One connected layer for modern commerce.

01

Orders

Multi-channel order flow in one place.

02

Inventory

Stock visibility across stores, warehouses, and channels.

03

WMS

Warehouse operations connected to the same context.

04

Product data

Structured product information where systems need it.

05

Integrations

ERP, e-commerce, POS, payments, logistics — connected, not replaced.

06

Customers

Shared customer context across channels.

07

Operations

Day-to-day commerce work in one operational view.

Connect the stack. Keep what works.

Leara builds a shared layer between the systems that drive commerce. Orders, inventory, and product data meet in the same place — while companies continue using the ERP, e-commerce, POS, payment, and logistics systems they already rely on.

Less fragmentation. Better flows. A clearer picture of the business.

That is unified commerce — developed in Sweden.
